Session: 03

Formatting Text Using Tags

Objectives

- Explain the Heading tag
- Explain the different tags related to formatting
- Explain monospaced font, preformatted text, and block quotation
- Describe the different types of lists
- Explain the procedure to change the background color and image

Introduction

Text content of Web page forms an important part of a Website.

Text must be attractive, easy to read, and should be short and crisp.

Text formatting options such as bold, italics, superscript, subscript, and so on must be applied to attract the user attention.

Background color and image of the Web page can be specified using HTML.

Headings 1-2

Heading elements define headings for contents such as text and images.

Specifies the hierarchical structure of a Web page by grouping the contents.

HTML defines six levels of headings ranging from H1 to H6.

- H1 is the top level heading and is displayed with largest font size
- H6 is the lowest-level heading and is displayed with smallest font size

Headings 2-2
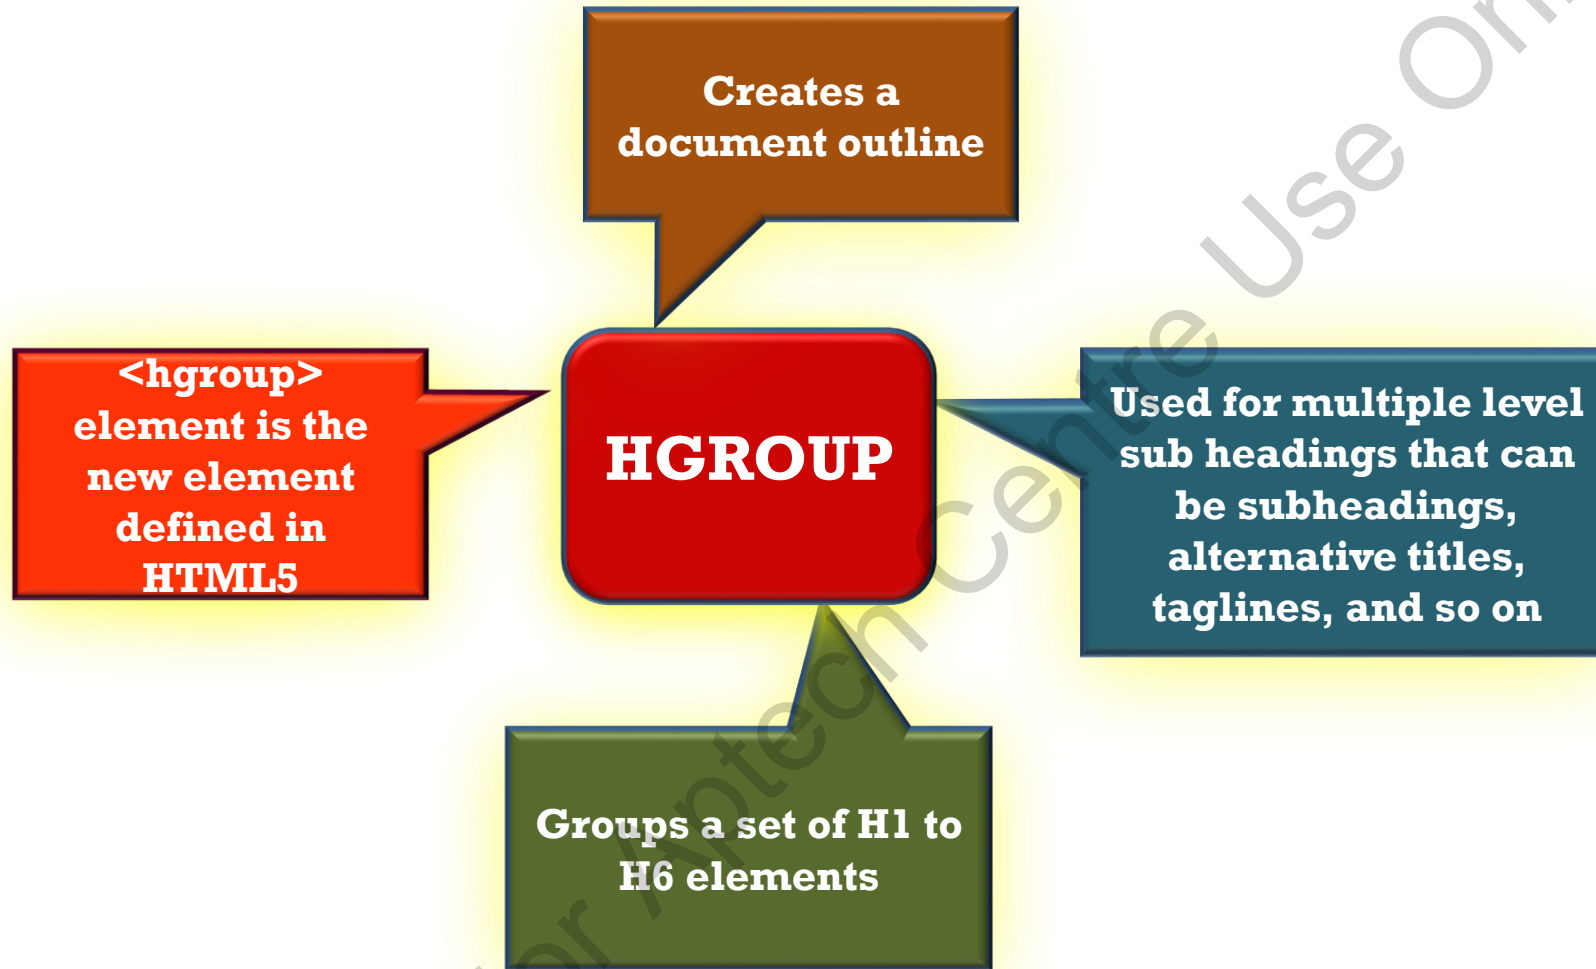

- Following Code Snippet demonstrates how to specify the six levels of heading in an HTML page:

```
<!DOCTYPE html>
<html>
  <head>
    <title>Headings</title>
  </head>
  <body>
    <h1>H1 Heading</h1>
    <h2>H2 Heading</h2>
    <h3>H3 Heading</h3>
    <h4>H4 Heading</h4>
    <h5>H5 Heading</h5>
    <h6>H6 Heading</h6>
  </body>
</html>
```
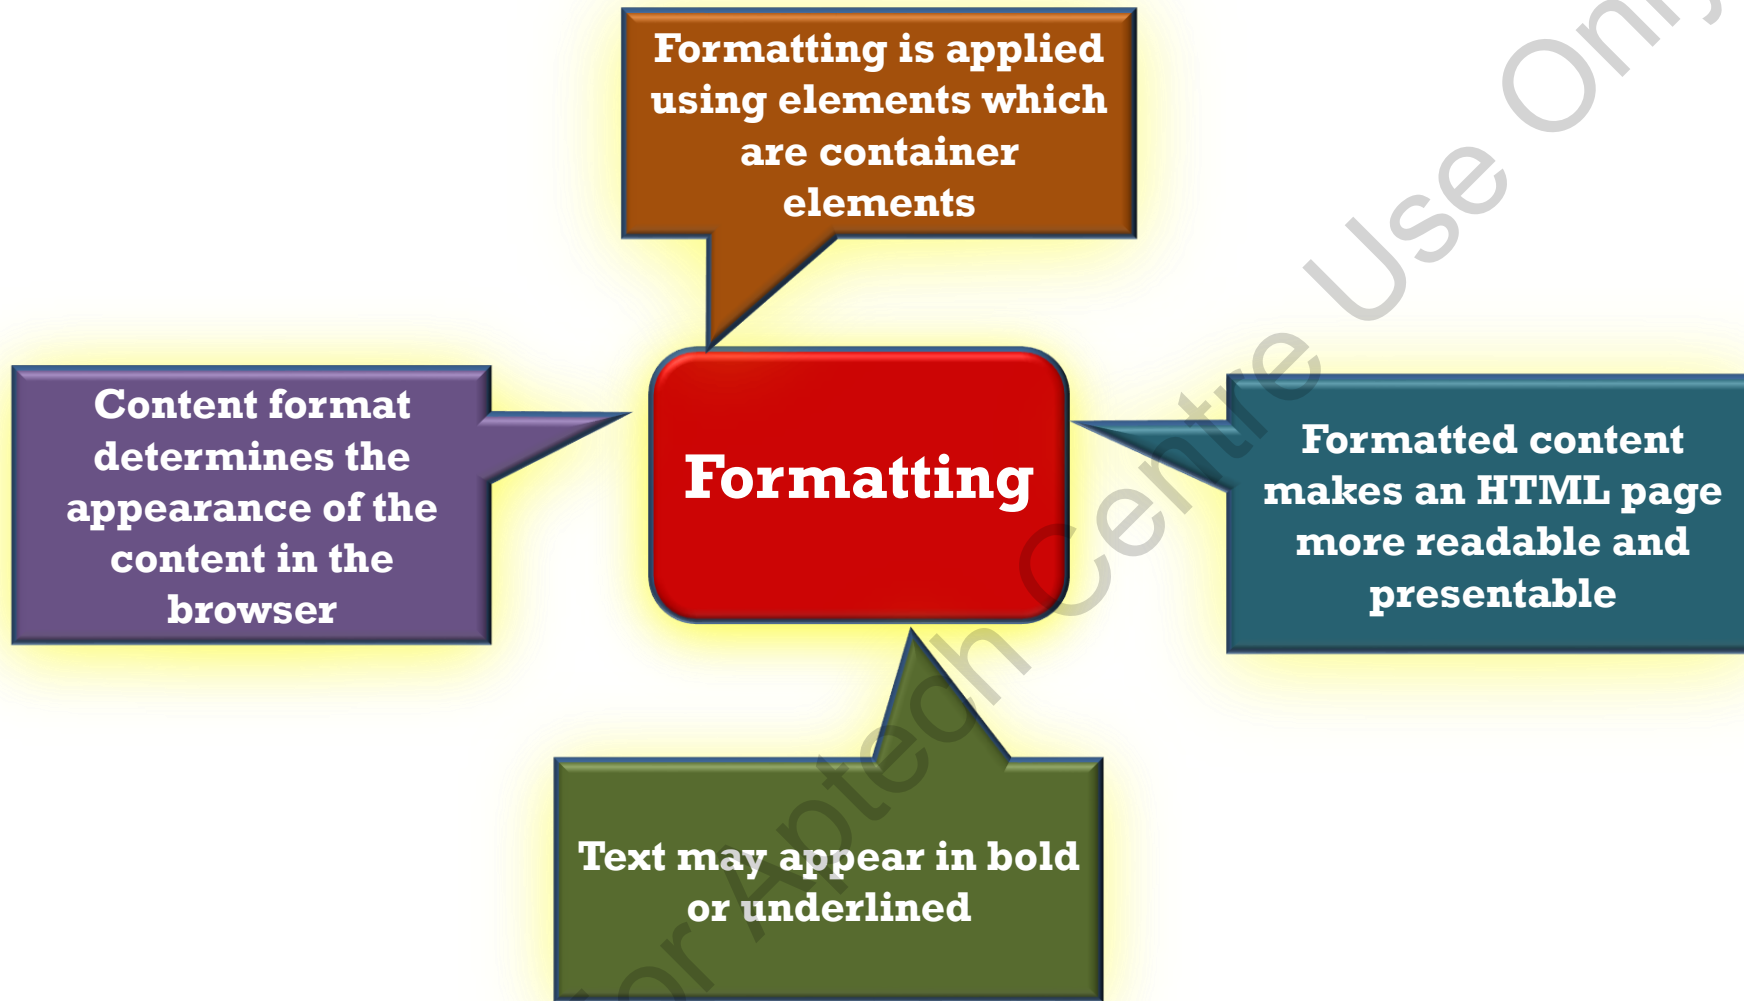

HGROUP

Creates a document outline

<hgroup> element is the new element defined in HTML5

HGROUP

Used for multiple level sub headings that can be subheadings, alternative titles, taglines, and so on

Groups a set of H1 to H6 elements

Formatting 1-5

Formatting is applied using elements which are container elements

Content format determines the appearance of the content in the browser

Formatting

Formatted content makes an HTML page more readable and presentable

Text may appear in bold or underlined

Formatting 2-5

- Commonly used formatting elements are as follows:

B element displays text in bold and is enclosed between \<b\> and \</b\> tags.

I element displays text in italics and is enclosed between \<i\> and \</i\> tags.
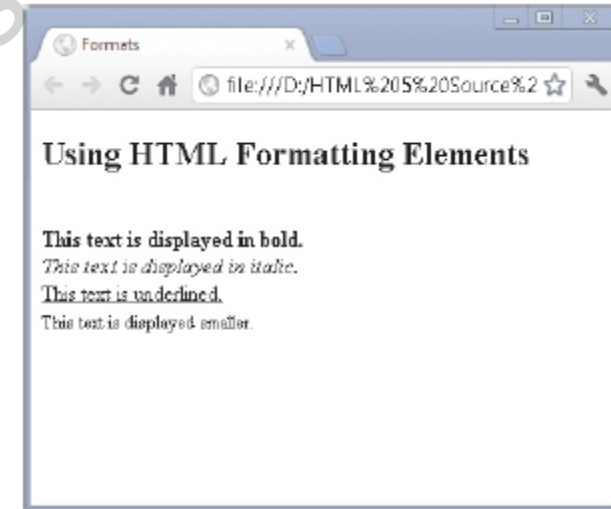

SMALL element makes the text appear smaller in browser and is enclosed between \<small\> and \</small\> tags.

U element underlines a text and is enclosed between \<u\> and \</u\> tags.

Formatting 3-5

- Following Code Snippet demonstrates the use of basic formatting elements:

```
<!DOCTYPE html>
<html>
  <head>
    <title>Formats</title>
  </head>
  <body>
    <h2>Using HTML Formatting Elements</h2><br>
    <b>This text is displayed in bold.</b><br>
    <i>This text is displayed in italic.</i><br>
    <u>This text is underlined.</u><br>
    <small>This text is displayed smaller.</small>
  </body>
</html>
```

Formatting 4-5

- Some more formatting elements are as follows:

DEL element encloses deleted text and is placed between <del> and </del> tags.

INS element encloses inserted text and is placed between <ins> and </ins> tags.

STRONG element emphasizes the text and is placed between and tags.

SUB element displays a text as subscript and is enclosed between _{and} tags.

SUP element displays a text as superscript and is enclosed between ^{and} tags.

Formatting 5-5

- **Following Code Snippet demonstrates the use of other formatting elements:**

```
<!DOCTYPE html>
<html>
  <head>
    <title>Updating and Shifting Text</title>
  </head>
  <body>
    <h3>Updating, Emphasizing, and Shifting Text</h3>
    This is an example of <del>deleted</del>
<ins>inserted
</ins> text.<br/>
    The is an example of <strong>Strong</strong>
    text.<br/>
    The is an example of
<sub>subscript</sub>text.<br/>
    The is an example of <sup>superscript</sup>
    text.<br/>
  </body>
</html>
```

Monospaced and Preformatted Text 1-2

Monospaced font allows the same amount of horizontal space between fonts irrespective of font size, shape, and type.

Monospaced fonts are used for programming code snippets, instruction texts, and ASCII characters.

<pre> tag is used for preformatted text content.

<pre> tag applies a fixed-font width to the text content.

<pre> tag allows you to copy-paste the content along with the formatting from the source.

Monospaced and Preformatted Text 2-2

- Following table lists some of the predefined tags and their description:

Tag	Description
`<em>`	Used for emphasized text
`<dfn>`	Used for definition term
`<code>`	Used for computer code
`<samp>`	Used for sample output from a computer program
`<cite>`	Used for citation

Formatting a Block Quotation
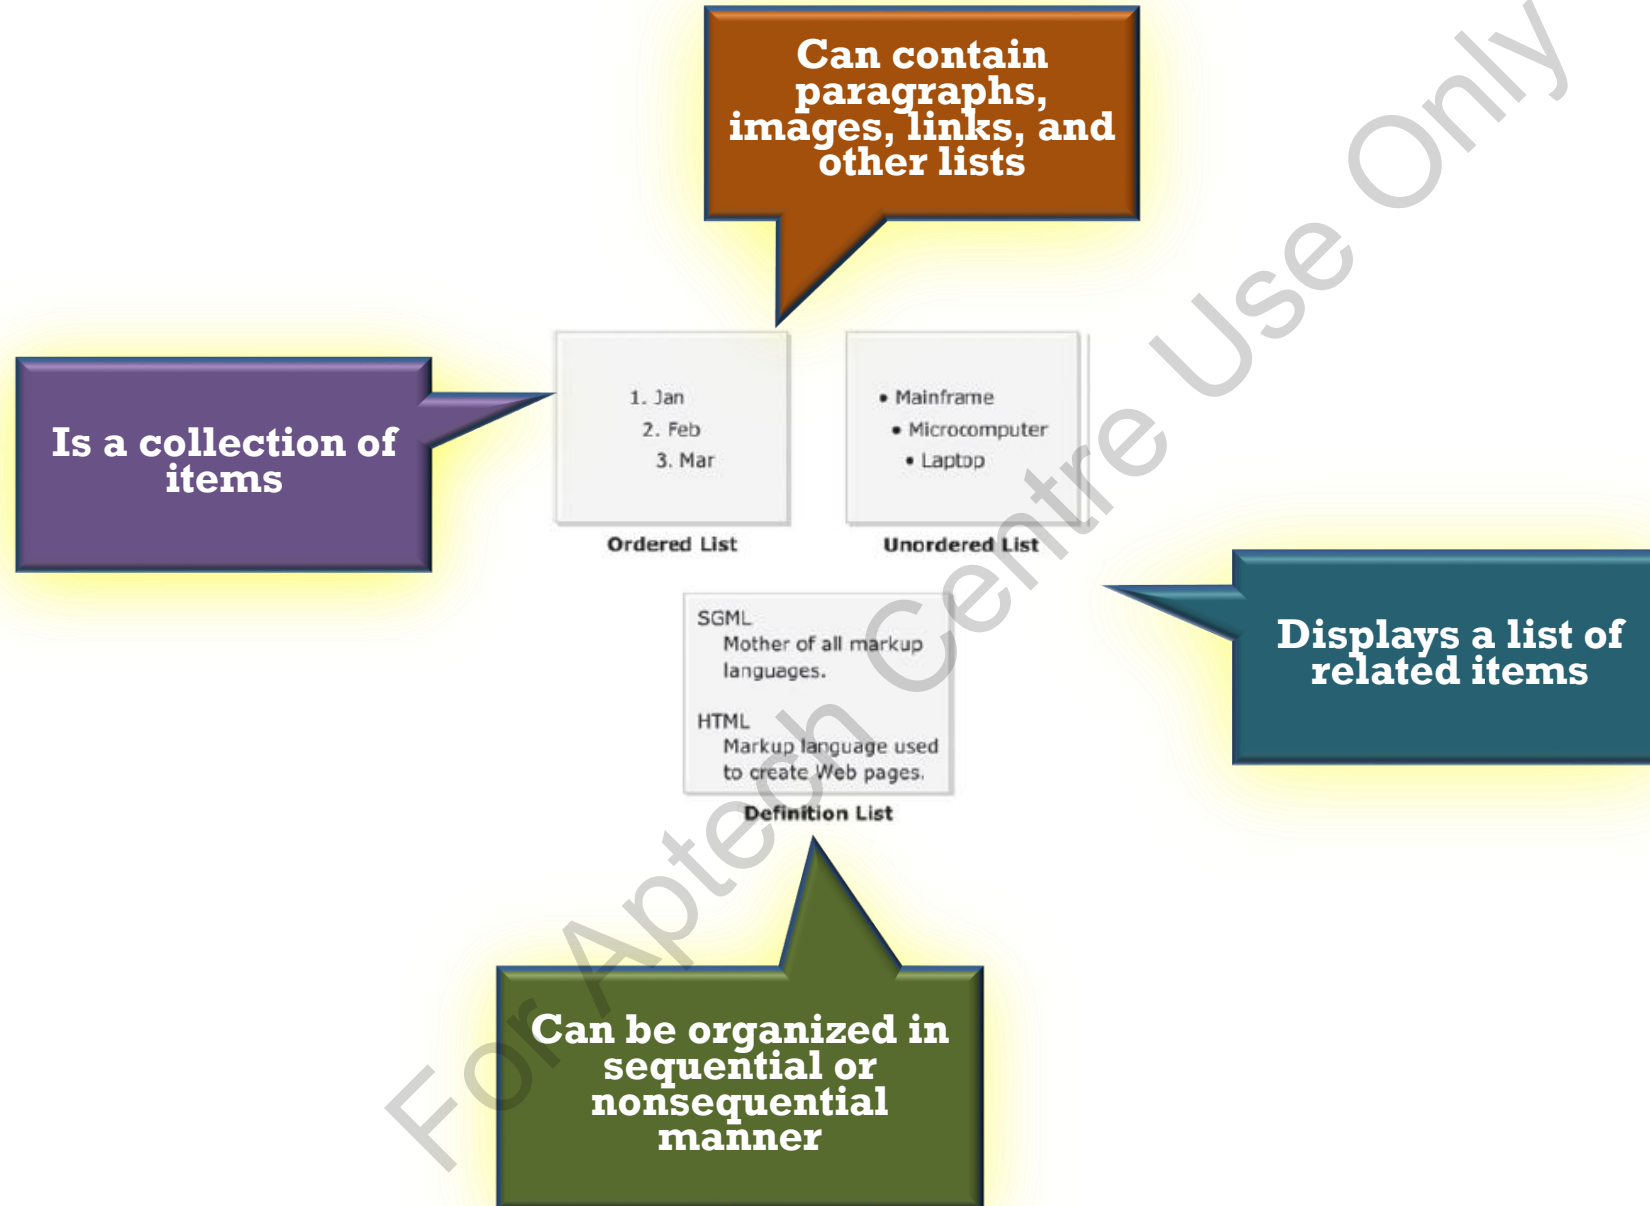

- **To define a long quotation or block quotation,** `<blockquote>` **tags are used.**
- `<blockquote>` **tag indents the quotation in browsers.**
- **Following Code Snippet demonstrates the use of** `<blockquote>` **tags:**

```
<blockquote>
"When one door closes, another opens; but we often look so long and so
    regretfully upon the closed door that we do not see the one which has opened
    for us." -Alexander Graham Bell
</blockquote>
```

Lists

Can contain paragraphs, images, links, and other lists

Is a collection of items

Displays a list of related items

Can be organized in sequential or nonsequential manner

1. Jan
2. Feb
3. Mar

Ordered List

- Mainframe
- Microcomputer
- Laptop

Unordered List

SGML
Mother of all markup languages.

HTML
Markup language used to create Web pages.

Definition List

Ordered Lists 1-2

- List is displayed using a numbered or alphabetic bullet

- Two elements used for creating an ordered list are as follows:
  - OL – Creates an ordered list
  - LI – Specifies an item and it is a sub-element of the OL element

- Following Code Snippet demonstrates the use of `ol` and `li` tags:

```html
<!DOCTYPE html>
<html>
  <head>
    <title>Days in a Week</title>
  </head>
  <body>
    <h2>Days in a Week:</h2>
    <ol>
      <li>Sunday</li>
      <li>Monday</li>
      <li>Tuesday</li>
      <li>Wednesday</li>
      <li>Thursday</li>
      <li>Friday</li>
      <li>Saturday</li>
    </ol>
  </body>
</html>
```

Ordered Lists 2-2

- Following table lists some of the different numbering styles and their description:

Property's Value	Example
decimal	1, 2, 3…
lower-alpha	a, b, c…
upper-alpha	A, B, C…
lower-roman	i, ii, iii…
upper-roman	I, II, III…

- `list-style-type` **property is used to specify a numbering style for the ordered list.**
- It is the property of the `style` attribute, which is specified with the `<ol>` tags.

Unordered Lists 1-3

- Items are arranged in random order
- Two elements used for creating an unordered list are as follows:
  - UL – Creates an unordered list
  - LI – Specifies an item and it is a sub-element of the OL element
- Following Code Snippet demonstrates the use of UL and LI tag.

```
<!DOCTYPE html>
<html>
  <head>
    <title>Features of EasyPad</title>
  </head>
  <body>
    <h2>Features of EasyPad</h2>
    <ul>
      <li>Opens many files at a time</li>
      <li>Unlimited undo and redo</li>
      <li>Reads and writes both
        Windows and Unix files</li>
    </ul>
  </body>
</html>
```
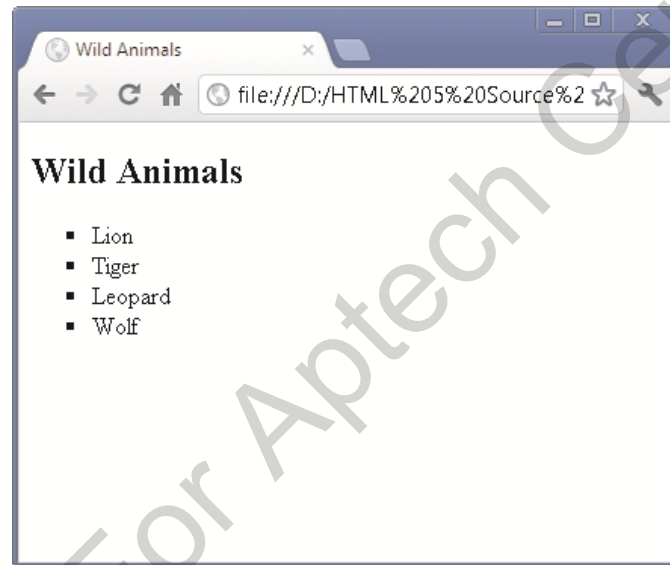

Unordered Lists 2-3

- The `list-style-type` property specifies the type of bullet to be applied to an unordered list.
- There are three types of bullets defined for the unordered lists:
  - Disc
  - Square
  - Circle
- The default value is disc, which is applied to the unordered list, even if the `list-style-type` property is not specified.
- Following Code Snippet demonstrates how to apply the square bullet to an unordered list.

```
<!DOCTYPE html>
<html>
<head>
<title>Wild Animals</title>
</head>
<body>
<h2>Wild Animals</h2>
<ul style="list-style-type:square">
<li>Lion</li>
<li>Tiger</li>
<li>Leopard</li>
<li>Wolf</li>
</ul>
</body>
</html>
```

Unordered Lists 3-3

- The `list-style-type` property of the style attribute is set to square.
- Hence, the unordered list of wild animals will be displayed using the square bullet as shown in the figure.

Definition List 1-4

- Refers to a collection of terms with their corresponding descriptions
- Contains the terms along with their descriptions
- Appears with the term indented on the left followed by description on the right or on next line
- Elements required to create a definition list are as follows:

DL – Is a container element that consists of DT and DD sub elements. Specifies that the definition list will be created using these elements.

DT – Specifies the term to be defined or described.

DT – Specifies the definition or description of the term.

Definition List 2-4

- Steps to create a definition list are as follows:

1. Specify the DL element to indicate that you want to create a definition list.

2. Use the DT element to specify the term such as Common Noun.

3. Use the DD element to specify the description of the term.

Definition List 3-4

- Following Code Snippet demonstrates the way to create a definition list.

```
<!DOCTYPE html>
<html>
  <head>
    <title>Types of Nouns</title>
  </head>
  <body>
    <h2>Types of Nouns</h2>
    <dl>
      <dt><b>Common Noun:</b></dt>
      <dd>It is a name of an object in general, such as
pencil, pen, paper, and so on.</dd>
      <dt><b>Proper Noun:</b></dt>
      <dd>It is the unique name of a person or a place.
      </dd>
    </dl>
  </body>
</html>
```

Definition List 4-4

Background and Foreground Colors 1-2

Background properties specify the background color and image for the Web pages.

Background property is a shorthand property that specifies all the background properties in just one declaration.

bgcolor attribute specifies the background color of a document.

- **Syntax for** `bgcolor` **is:**

`<body bgcolor="color_name|hex_number|rgb_number">`

where,
    `color_name` - Specifies the background color with a color name (such as "red")
    `hex_number` - Specifies the background color with a hex code (such as "#ff0000")
    `rgb_number` - Specifies the background color with an rgb code (such as "rgb(255,0,0)")

Background and Foreground Colors 2-2

Another way to specify a background color for a Web page is by using the style="background-color: color" attribute.

This attribute must be added to the style attribute of the <body> tag.

The foreground color can be specified by using the style="color: color" attribute.

- Example demonstrating the specification of background and foreground color is:

```
<body style="background-color: navy; color: yellow">
```

Background Image File

Choose an image that blends well and looks like a single image even after tiling

Inserts an image as the background on a Web page

Background Image

Choose images with lighter shades

Background images are not recommended as the color may hide the text

Summary

❖ The heading elements define headings for contents such as text and images.

❖ The <hgroup> element is used to group titles and their subtitles.

❖ Monospaced fonts are used for programming code scripts, instruction texts, and ASCII characters.

❖ The <pre> tag is used to apply preformatted text content to a Web page.

❖ To define a long quotation or block quotation, the <blockquote> tag can be used.

❖ A list is a collection of items, which might be organized in a sequential or nonsequential manner. HTML supports three types of lists namely, ordered, unordered, and definition.

❖ HTML provides background properties that specify the background color and image for the Web pages.
